Extended Project Description	https://docs.google.com/document/d/1HpflwUUQgyQtFd1dMRjyoHYrDoZcacI_/edit

Goals	A deliverable product that satisfies the customers needs, Quality and Testing, User Satisfaction
	Apply best practice, deliver high quality code & documentation (by standards of the industry partner)
Meeting norms	Be punctual
	If attendance is not possible write a signal message to the team at least 1 day before.
	Find a balance for meeting/working time
Working norms	Be productive and do not have major crunch times.
	Automated testing, automated linting (to achieve uniform code style)
	Work with branches (bugs, features, ..)
	Work with development, staging and production stages
	Use technologies as defined by the industry partner (Programming language, AI framework, etc)
	Always review code before merging (by pull request)
Coordination norms	Work items are assigned to specific team members, the member feels responsible for its completion and to notify the team about issues
	Team members may form small groups / teams to work on components or tasks together
Communication norms	Communicate in case a meeting does not work out as early as possible, at least the day before
	Main channel is Slack, SD should communicate privately in case of specific issues
	Communicate technical issues in a corresponding slack channel of our team.
	Criticism should always be constructive, we do not tolerate bullying
Consideration norms	Discuss Issues with the team
	Transparency, providing clear information to customer
	Valuing customer's feedback
	Each team member's opinion is valued equally
Cont. improvement norms	Implement feedback of the team from previous weeks
Rewards	Everyone gets a drink of their choice (people in the same city can meet up) and post a picture in our group chat
Sanctions	A reason for being late on a meeting needs to be given.

Product Vision	Project Mission
<p>This product will give our industry partner a tool at hand, that can effectively increase conversion of their leads to customers, primarily by providing the sales team with valuable information. The modular architecture makes our product future-proof, by making it easy to add further data sources, employ improved prediction models or to adjust the output format if desired.</p>	<p>The mission of this project is to enrich historical data and the basic data obtained from current leads with information from external sources (e.g. Google API, GPT, ...). The enriched historical data is then used to train a machine learning model, that will rank current leads in terms of their estimated life-time value to our industry partner.</p>

Term	Definition
Base Data Collector (BDC)	One of our main two software components which fulfills the task of collecting data about a lead from various online sources.
Expected Value Predictor (EVP)	The other main software component which takes the enhanced data about a lead and estimates the expected value of that lead.
Software Component	Major part of our product, which is mostly independent from other components (i.e. can be run separately).
Lead	Potential customer of SumUp which has already declared their interest in purchasing products or services (through the online form).
Controller	Software component that orchestrates BDC and EVP, leading them to an efficient collaboration.
Internal Data Source	Our industry partner providing us with their data about leads. This can be both previously collected or "live data" from new leads.
Provided Data	Data from the internal data source that serves as primary input for BDC. This data contains few features and is possibly irregular.
(Data) Feature	A common property among multiple data records (e.g. first / last name, phone number).
External Data Source	Third party providing us with data about a lead. In theory this can be the lead themselves (e.g. via information on their website).
Collected Data	All data about a lead, which has been collected from an external data source.
Enhanced Data	Combination of provided and collected data, possibly enriched by some derived features.
Output Data	Data which is produced by the EVP. It contains only features that are relevant for decision making from a sales point of view.
Expected Value	The revenue to be expected from a lead (expected value = life-time value of lead x probability of lead becoming a customer).
Lead Quality Index	An index in the range from 0 to 1, which is based on the leads expected value and can be used to rank or classify leads.

Sprint	Sprint goal
1	Get Communication and Team Work going and establish a good working mode during meetings and with industry partner
2	Develop prototypes of BDC and EVP and possibly of the Controller, evaluate some first external data sources, do research on AI and AWS.
3	Establish further data sources and identify the challenges of collecting data. Put together all components and establish an automated build toolchain.
4	Use collected data to train and evaluate first iteration of the EVP. Improve current BDC data sources in terms of quality and quantity. Generate reports.
5	Continue work on BDC: Lay more focus on data-robustness and relevance for prediction. Use GPT to preprocess natural language data. Improve reports.
